

Ok, HEX colours.

‘The code of which websites use.’ (#000000 = Black)

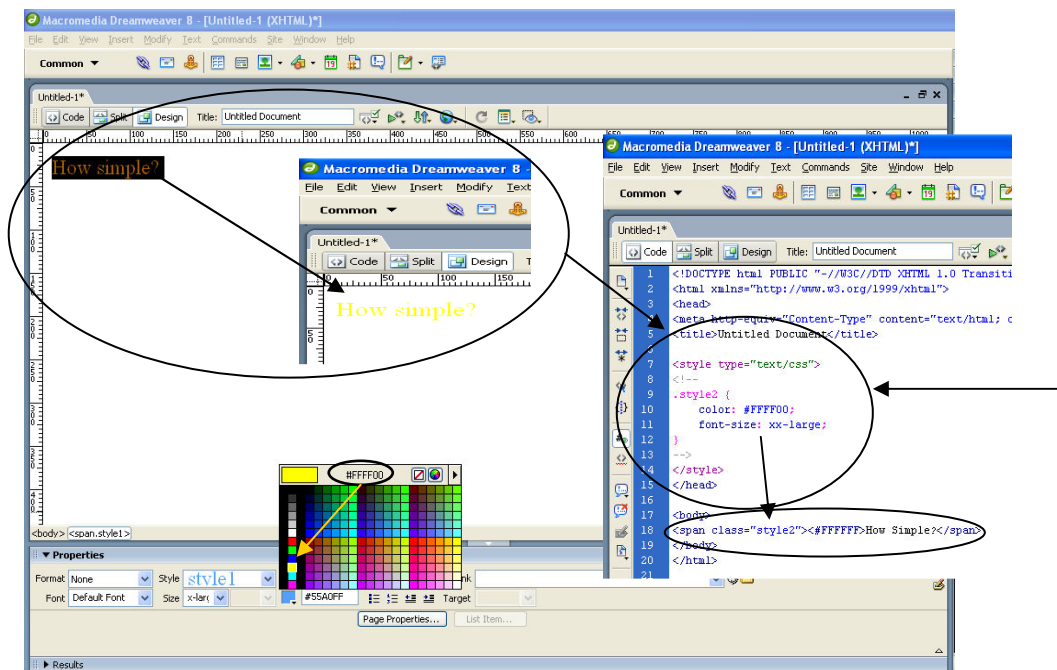

Confused already? No need to be.

Let’s start on Dreamweaver uses.

As you can see, the text is a default black.

So, if you where to change the colour to Yellow, the code would be ‘#FFFF00’

The HTML code in Dreamweaver is a bit different to normal HTML; this automatically makes a page code (or page style sheet) for that colour

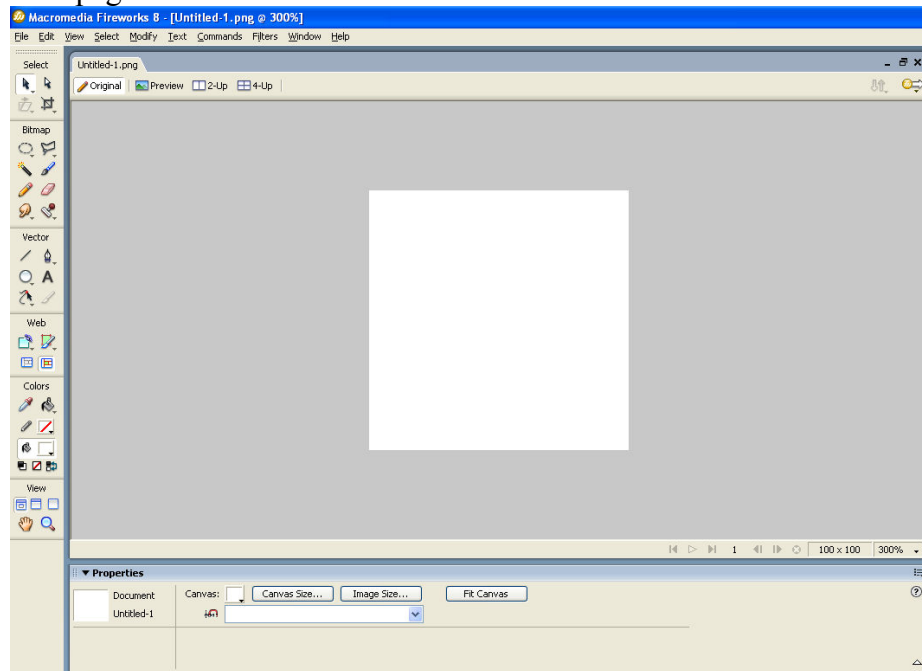

The text would then change.

Do you get it? No, Well... I don’t know how to explain it better. Sorry!

Now for fireworks!

Same concept White = #FFFFFF

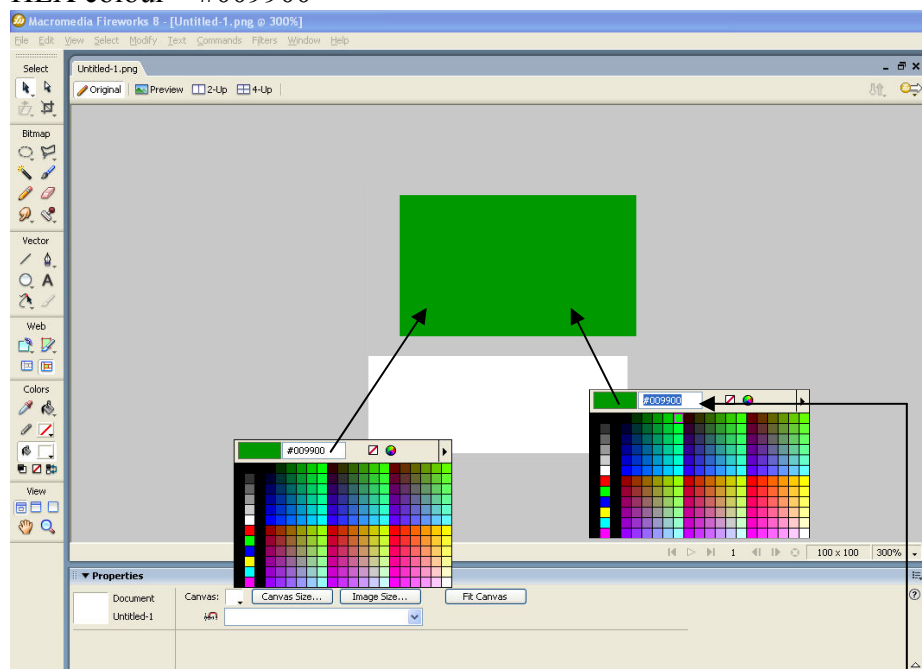

This page is white so the HEX colour is?

White! #FFFFFF

Now, this shall be changed to... A Dark green.

HEX colour = #009900

There, selected the colour, Dark green using the colour select tool.

Or, could just type the HEX colour in?

Easy! As That!
